

CPU Scheduling Scenario

We will simulate the Highest Priority First (HPF) algorithm.

The following processes arrive at the system:

Process 1 arrives at time 0, requires 8 units of runtime, priority is 2, memsize is 1.

Process 2 arrives at time 1, requires 4 units of runtime, priority is 1, memsize is 1.

Process 3 arrives at time 2, requires 9 units of runtime, priority is 3, memsize is 1.

Process 4 arrives at time 3, requires 5 units of runtime, priority is 1, memsize is 1.

Process 5 arrives at time 4, requires 6 units of runtime, priority is 2, memsize is 1.
